

Team CodeGen — CivicPulse

ATHARAV — Opening

"Good morning everyone.

We are **Team CodeGen**, and our project is **CivicPulse**.

Every day, we face civic problems like potholes, garbage, broken streetlights, and water leakage.

But reporting these problems and tracking them can be difficult.

So, we created **CivicPulse** — a platform where citizens can report problems and track their progress.

Our main flow is:

Report → Analyze → Track → Fix.

Now, let's see how our project works."

SHERYA — Demo Story

"Let's take a simple example.

Imagine I am walking on the road and I see a pothole.

Instead of ignoring it, I open CivicPulse, upload a picture, add the location, and report it.

After submitting, I can track my complaint and see its status.

Now, let's see how a citizen uses CivicPulse."

RYTHM — Frontend & Citizen

"Hi, I'm Rythm.

I worked on the **frontend, login, and citizen section**.

A citizen can log in, report an issue, upload an image, add details, and check the complaint status.

We designed it to be **simple and easy to use**.

Now, Ayush will show how AI helps us.”

AYUSH — AI & Image Analysis

“Hi, I’m Ayush.

I worked on the **AI and image analysis**.

When a citizen uploads an image, our AI analyzes it and helps identify the problem.

For example, it can detect issues like potholes or garbage.

This makes the reporting process faster and smarter.

Now, Vanshika will explain the backend and maps.”

VANSHIKA — Backend, Database & Maps

“Hi, I’m Vanshika.

I worked on the **backend, database, and maps**.

When a complaint is submitted, its details, image, location, and status are saved in the database.

The map helps us see exactly where the problem is.

This makes it easier to manage and track different issues.

Now, Ishant will show the autonomous system.”

ISHANT — Autonomous Missions

“Hi, I’m Ishant.

I worked on the **autonomous mission system and mission dashboard**.

After an issue is reported, we can create a mission for a simulated drone or robot.

It can be used to inspect the reported location.

The dashboard shows the mission, location, and current status.

Now, Atharav will explain how everything comes together.”

ATHARAV — Integration & Overall Workflow

“So, all these parts are connected together in CivicPulse.

The citizen reports the issue.

AI analyzes it.

The backend stores the data.

Maps show the location.

And the **autonomous system can help with inspection.**

I also worked on the **GitHub, code integration, and overall coordination** to bring these different parts together.

Now Sherya will give you the final conclusion.”

SHERYA — Final Closing

“So, CivicPulse is not just a complaint website.

It creates a complete connection between **citizens, technology, and civic action.**

Our goal is simple:

Report the problem.

Track the problem.

Fix the problem.

We are **Team CodeGen**, and this is **CivicPulse.**

Thank you!”
